Hackers and Painters Follow Up Discussion

Instructions: In one color, record your reflection to the following questions. Then in a second color, record your group's response.

Graham says programmers are makers, like painters and architects, not scientists or engineers. Do you agree, and does it hold for every kind of programming?
He argues that programs are worked out while they're being written, which favors flexible, dynamically typed languages. Does the popularity of statically typed languages like Rust today undercut that claim?
Graham praises both empathy for users and care for details no one will see. Are these in tension, and does "beautiful code" still matter when AI writes and reads more of it?
